Screenshots With explanation.

This is just the small overview of the project as everything cannot be shown in just docs/with screenshots.

Also due to time limitations I have not focused much on the UI.

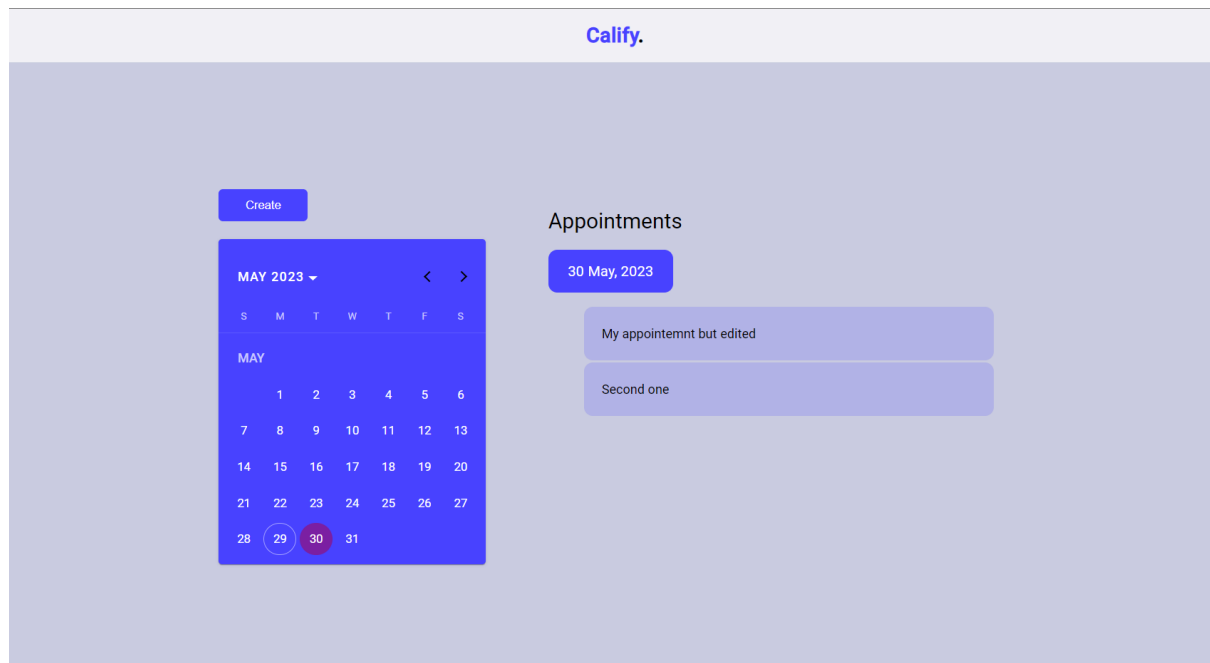

Home Screen.

This is the default route with the datepicker component on the left side and the list of appointments on the other side.

The appointments can be filtered according to the date selected in the date picker. Here is the example below.

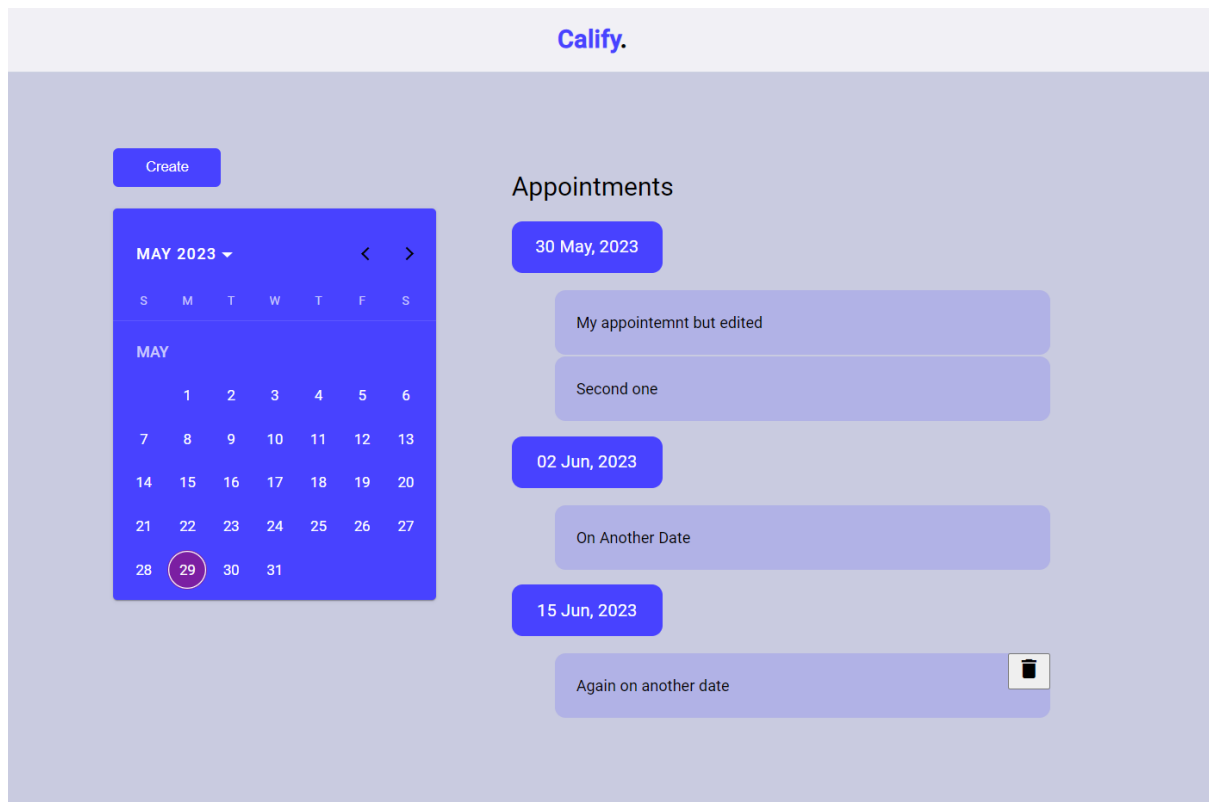

I have chosen the 30th May, 2023 so all the appointments will be shown on that date.

Now to create a new appointment we can click on the create button above the date picker. And it will redirect us to the new route which is create.

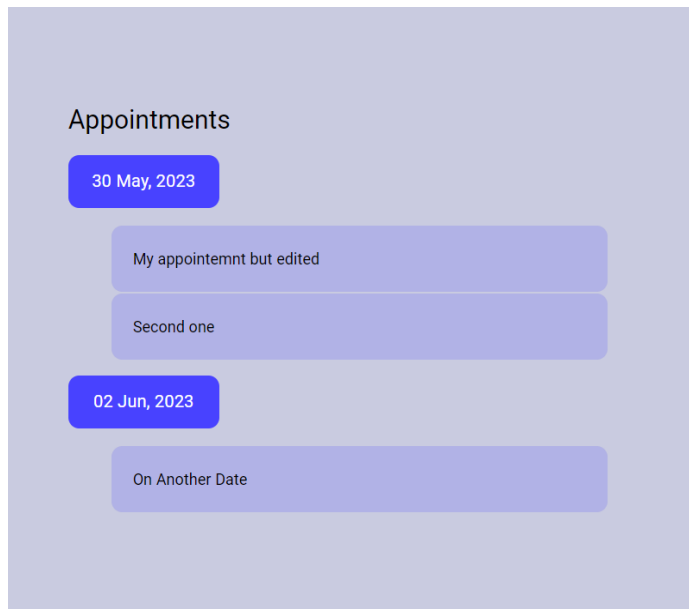

Here is the screenshot.  
Create page/route.

As you can see by default if the date and title are not filled the create button will be disabled.

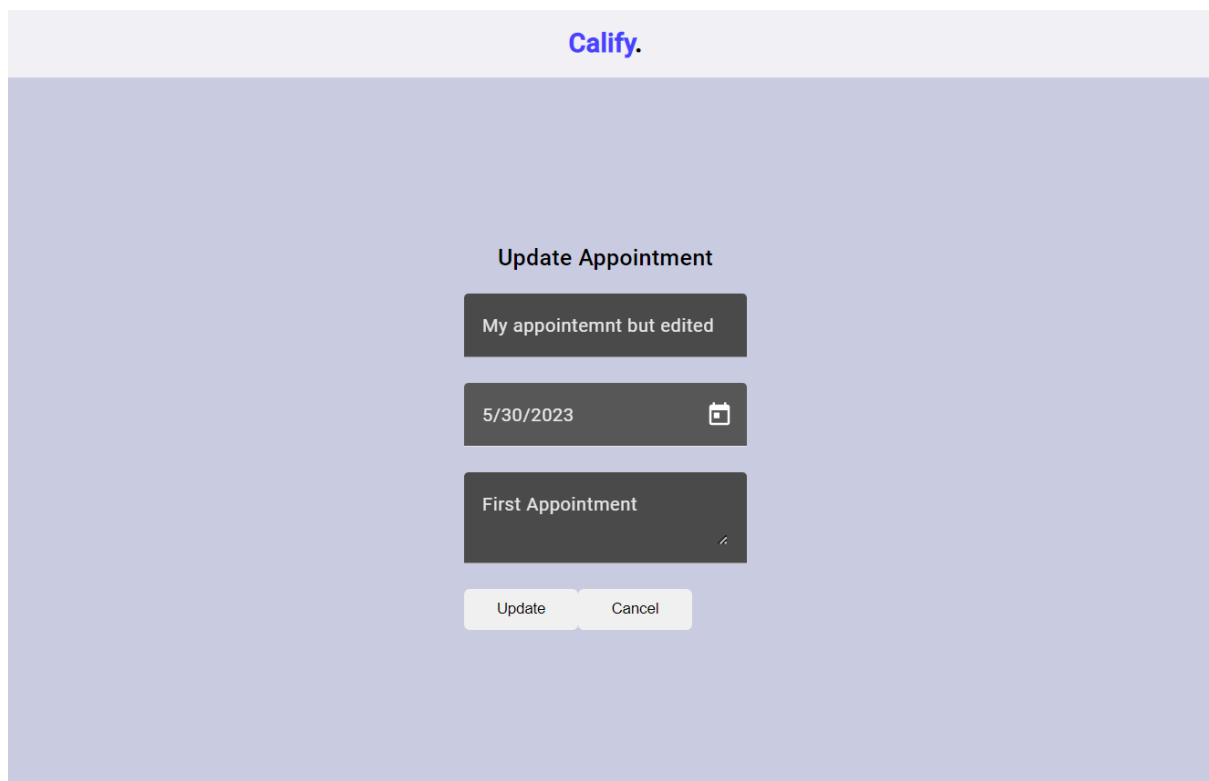

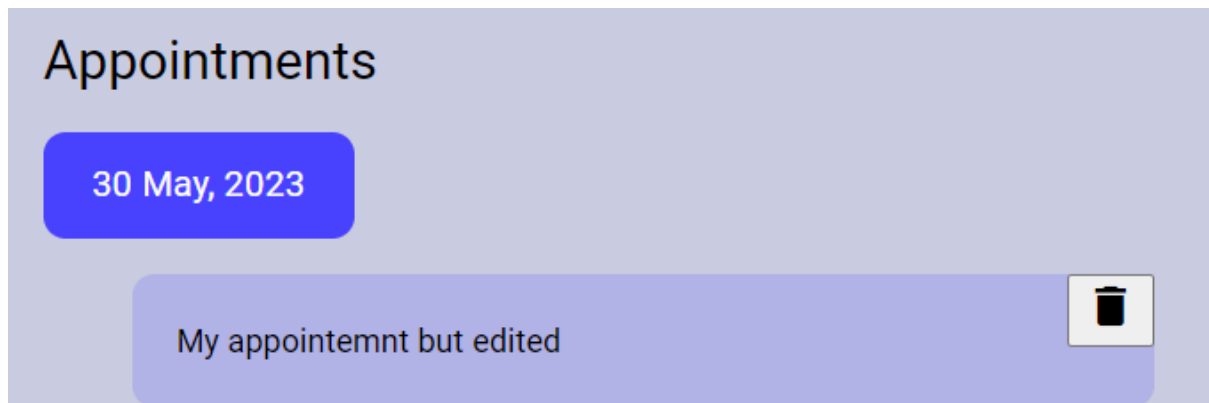

Now if i hover over any appointment a delete button will appear on the right side of the appointment.

And it will be deleted upon click.

To edit the appointment we just need to click on the appointment and we will be redirected to the same form used to create the appointment with the values already there.

If i click on this appointment.

You can see that the text above has changed from create appointment to update appointment.

And the button to update from create.

Now we can just update the values and click on update and the appointment will be updated.
